Rules and skills: how the harness changes the policy context

Explicit contracts + progressive disclosure; the learned checkpoint and diagnostic tools are shared

a Rule contract

`rules.md | v1.1.0`

R007 Output structure
One JSON object per turn.

R018 Tooth identity
Use FDI two-digit tooth numbers.

R008 Final findings
List all investigated findings.
No target pathology: empty list [].

render

b Policy context

System instructions
Existing rules, rendered verbatim

Skill index
Names + short descriptions

Episode state
Image + conversation + tool history

Requested body
Added only after a read_skill action

index

c Skill library

skills/<name>/SKILL.md

- box-verification
- **caries-vs-deep-caries**
- periapical-lesion
- impacted-tooth
- healthy-scan-negative-survey

Each file: version, sources, body

append to history

d On-demand retrieval during an episode

1 Policy requests context

`tool: read_skill`

`args.name:`

`caries-vs-deep-caries`

A harness action, not tool #9.

2 Dispatcher + session

Validate the requested name.

Read the allow-listed skill file.

Return body, version and sources.

No diagnostic tool is executed.

3 Retrieved content

SKILL caries-vs-deep-caries

Caries and Deep Caries are distinct permitted output labels. [S2]

v1.2.0 + source references

e Observable intervention

harness_events: listed / loaded; skill, version, content hash, turn, elapsed time and mode

Rules-only = prompt identity control. On-demand = index first. Full injection = all five bodies first.

Source-grounded schematic: rules.md, skills.py and the shared dispatcher. Skill excerpt is from the existing file, not a new clinical rule.
