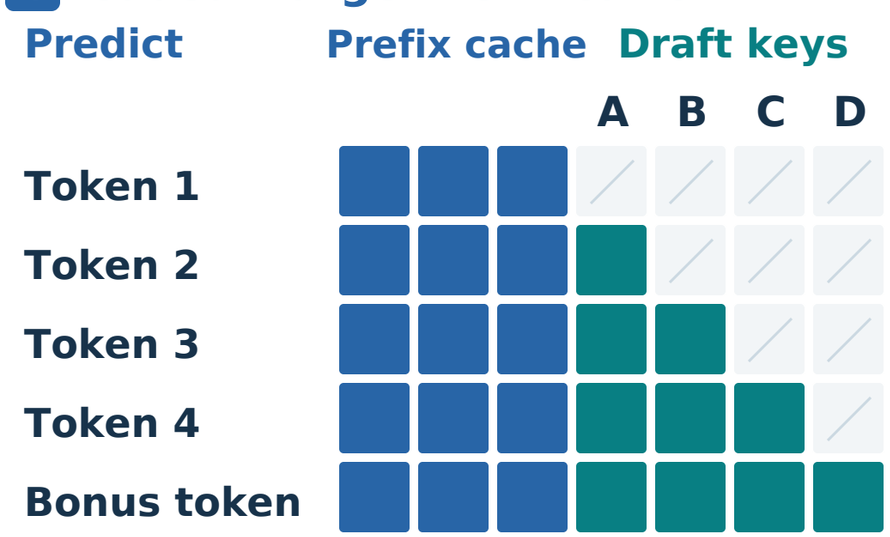
Speculative decoding: propose a block, verify it, commit the valid prefix

A trained draft proposes tokens; the fixed target checks them before they enter the output

a Propose several next tokens

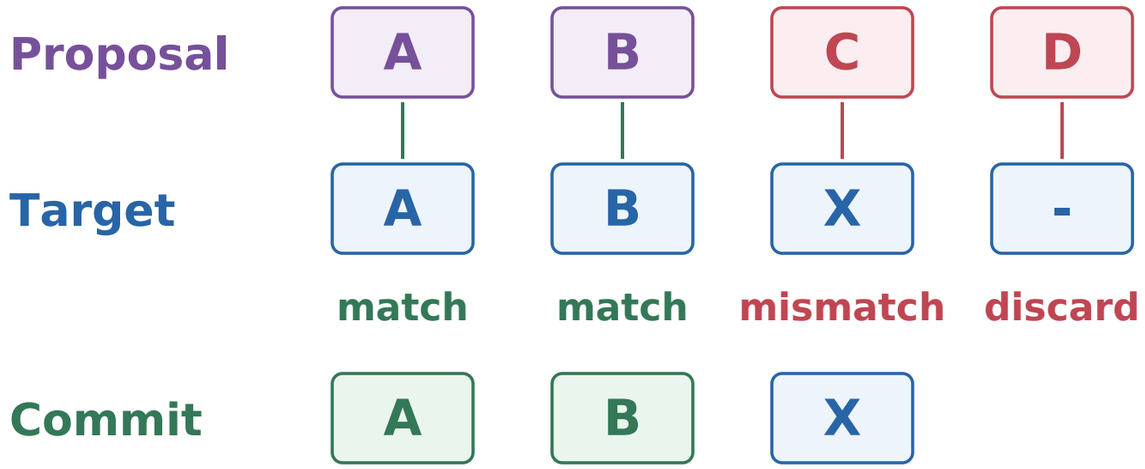
Draft first; verify the block with the target. Accepted tokens extend the committed context.

b Causal target verification



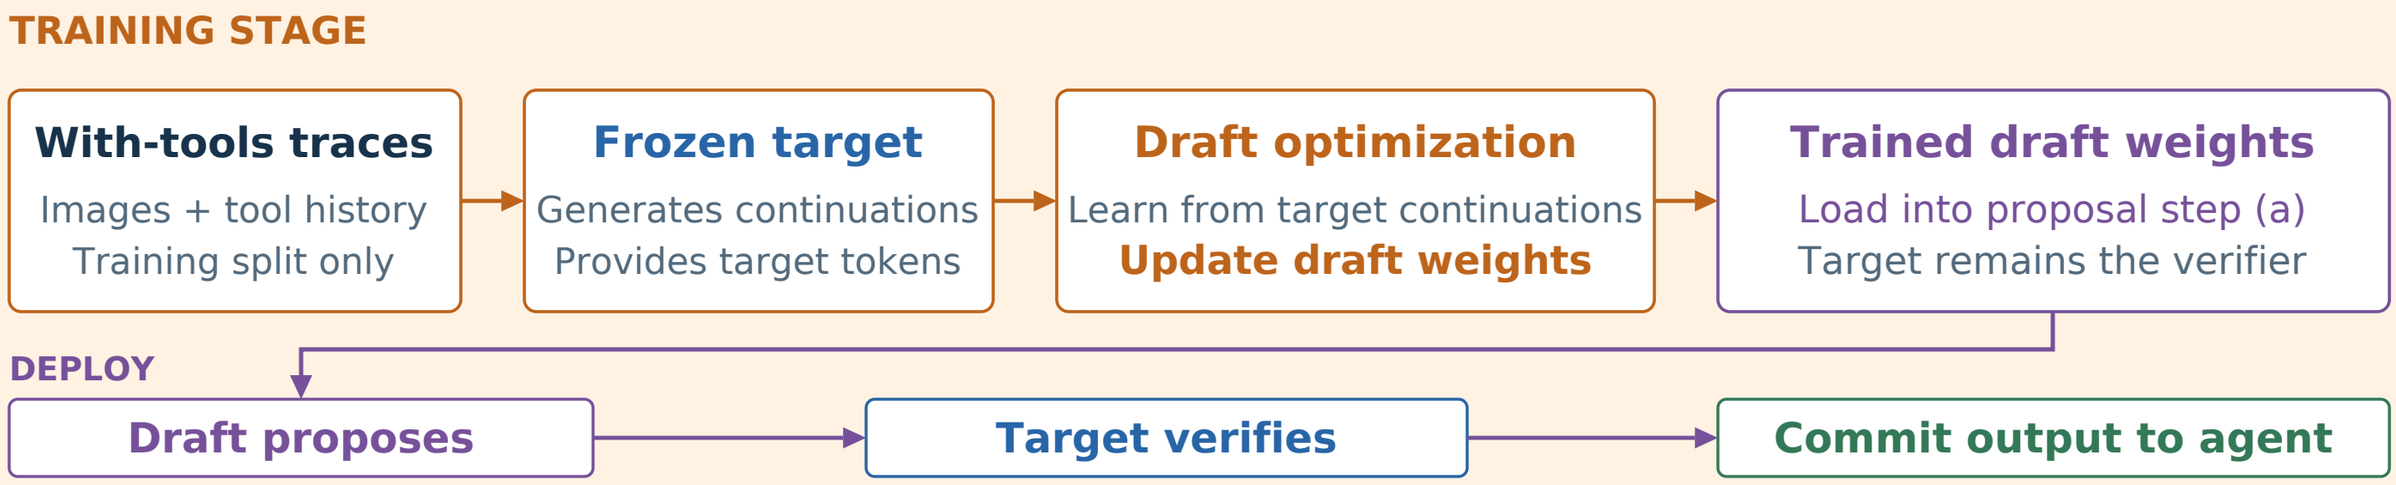
Predict four new tokens, plus a possible bonus.
Colored cells = visible keys, not attention scores.

c Accept / reject with greedy target output



Keep A, B; use target correction X at the first mismatch.
Drop C and dependent D. If all match, a bonus token is possible.

d Planned draft training and deployment



Symbolic token example. The trained draft proposes; only target-verified output enters the existing agent/tool loop.
