A Versioned behavioral contract

Existing instructions, implementation-linked IDs

rules.md | v1.1.0

R007 FORMAT

Structure every turn as EXACTLY ONE valid JSON object, no markdown, no commentary outside it.

R002 BOX VERIFICATION

`locate_tooth`'s box is a starting point, not a guarantee.

```
R009-R012 : reward bindings
R013 : verifier binding
AST/content digests detect drift
```

B Procedural context on demand

Progressive disclosure; no learned-weight update

Skill index | names + descriptions

```
box-verification
caries-vs-deep-caries
healthy-scan-negative-survey
impacted-tooth
periapical-lesion
```

box-verification | v1.2.0

Inspect the returned crop.
If misaligned: nudge, then re-inspect.
dx/dy are fractions of box width/height.

C Executable boundary

Shared routing; eight diagnostic tools

Harness action (not tool #9)

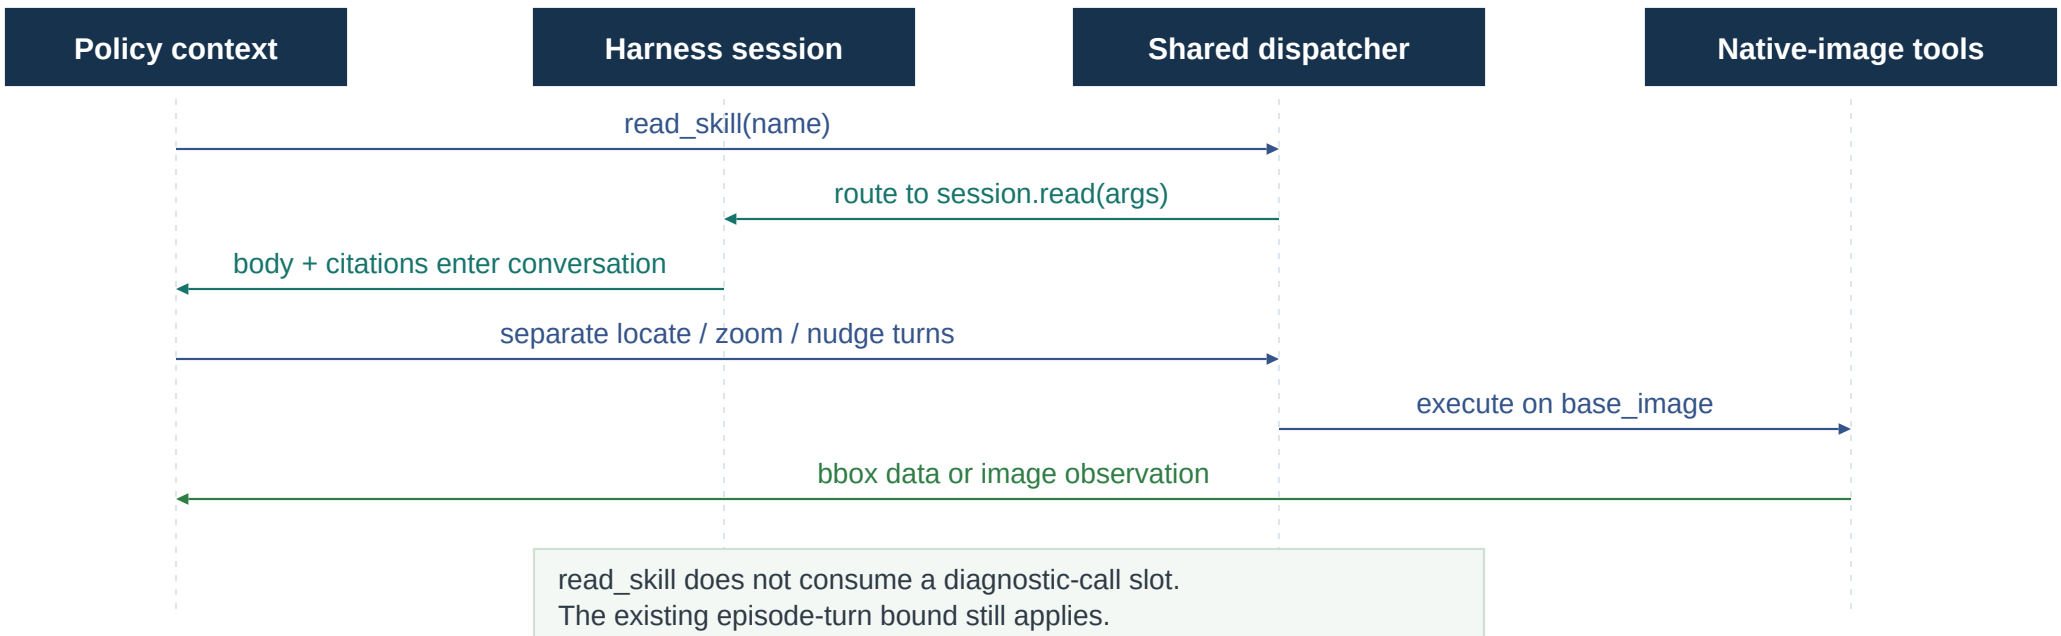

```
tool: read_skill
args: {name: box-verification}
returns: body, sources, version
```

Diagnostic registry (unchanged)

`locate_tooth`	bbox
`nudge_crop`	revised bbox
`fdi_label`	FDI data
`zoom_crop`	image
`window_level`	image
`enhance_contrast`	image
`denoise`	image
`contralateral_compare`	image

D What changes in an episode

Illustrative request/reply ordering through the existing shared dispatcher

read_skill does not consume a diagnostic-call slot.
The existing episode-turn bound still applies.

E Controlled comparisons and audit trail

Same checkpoint, images, tools and budgets; context is the intervention

OFF / baseline	existing prompt
rules only	byte-identical rendered prompt
index + on demand	index first; requested bodies later
full injection	all five bodies in initial context

Optional harness_events

```
event: listed | loaded turn: <index>
elapsed_seconds name version
sha256 mode repeat
```

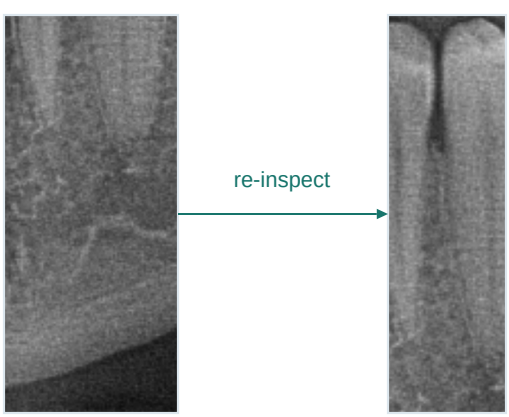

Prompt identity is a control, not an accuracy claim. Disclosure is logged rather than inferred.

Source: rules.md, skills.py, agent/loop.py, tool_dispatch.py | rules SHA-256 42c3cc3e4946

F Visual re-inspection and box-relative geometry

Existing teacher training example: DENTEX image 624; not a harness-effectiveness measurement

Initial view **After nudges**

nudge_crop changes coordinates, not pixels.
zoom_crop must show the revised box before diagnosis.

```
cx_new = x + w/2 + dx_frac * w
cy_new = y + h/2 + dy_frac * h
w_new, h_new = max(scale,0.1) * (w,h)
Clamp size and corner to native-image bounds.
```

The same native source image feeds every diagnostic call.
A prior crop never silently replaces base_image.
