
evaluation protocol (frozen)

test	DENTEX official validation: 50 images (46 pathological, 182 target teeth; 4 healthy), used once
dev	all choices on a fixed dev split of ~70 training images, drawn once with a fixed seed
metrics	set-matched pooled F1 (exact, tooth-only) · invented findings on healthy images · no-answer rate · ECE
uncertainty	bootstrap over images; paired comparisons on the images conditions share

probes on the trained checkpoint (nothing retrained):
tool removal · grounding perturbation · group-size sweep $K \in \{1, 2, 4, 8, 16\}$ on dev
